Dear Lawrence,

I am sharing the logo file and terms & conditions along with.
 Email to use: tellus@entuze.com / password: tell#123. This is a paid google mail
 I am not clear about what do you mean by text name of the platform. If it is a display name, then put as "Entuze Enterprise Solutions"

Regarding SSL let us hold for now. I am getting clarity from the client side. I will confirm the name soon.
 Let me know if you need any other detail.

Regards,

Sudhendu Basu

 gentlemen, i'm at a stopping point until you finalize the domain name. you can take a look at the config repo here: <https://github.com/entuze/edx.configuration>

whenever convenient pls send the following:
 - logo file, preferably in png or svg format
 - login / pwd to the SMTP email account for the platform. if you don't have any account yet then pls keep in mind that gmail is a great, free solution for this.
 - text name of the platform
 - text (if any) for legal disclaimer in the footer of the site

thanks,

Lawrence McDaniel

This will be a sub domain of entuze.com.
 If we give a name now, can that be changed later on?

Thanks,

Sudhendu

good morning! confirming that i am beginning work on your open edx installation. first order of business regarding the EC2 instance you created for me. unfortunately you built the instance with an Amazon Linux machine image whereas we need to do the installation on ubuntu 16.04. i'm going to delete and recreate the instance now. also, please note the following:

1. i am using the tag name "McDaniel" to identify all AWS resource which i'm using for this project. please do not rename these until after i have completed.

2. i created a new elastic IP address for this server
3. i will delete and re-create the AWS security group so as to give it a more appropriate name
4. i will reuse the pem key that you sent me.

thanks! :)

Hello Lawrence,

We have created a t2xlarge instance. Attaching here the details of same.

1. Screenshot of EC2 instance created
2. .pem generated for this instance

I hope you already have log-in id and password.

If needed we can have short online session tomorrow morning your time.

With Regards,

A. Chatterjee

ok. based on the learner volume you describe below you'll want to deploy with a t2.xlarge (4 cpu, 16gb RAM) with 100gb file system. it's also probable that not long after deployment you'll need to host mongo and mysql in remote virtual servers, using say t2.large instances for each.

please send me the connection parameters once these are available and i'll confirm once i've connected successfully.

Hi Lawrence,

We have got a different thought. Instead of upgrading the existing server, you may please install a new server and install the Ironwood afresh. We will shut down the current sandbox after your installation of the new instance and that will make your process much simpler.

Since it will be for a new client, we expect an overall user base of 1000 to 2000 initially, which may go to 10000 over the year. However, the concurrent user may be around 100 to 500 initially. Considering this, I think we can go for M4.Large unless you feel a bigger size is required. Existing RDS and S3 bucket may be used. Let me know if there is any challenge.

Hi Lawrance,

We have a production server running on old edX version, which is completely delinked from the sandbox.

We have not done any modification in the sandbox neither having any activity on that. After your installation of Hawthorn, we have only loaded some dummy content to test it. You may shut down the sandbox server and install Ironwood in that. Those dummy content need not be backed up and can be destroyed. You may use the existing S3 and RDS as needed.

After installation, please create two admin login for me and Aninda. For any issue, you may contact me and Aninda.
